Cost-per-Clean Worksheet

Compare products by what each clean costs, not by the shelf price.

Cost per clean = price paid ÷ number of cleans in the pack. Number of cleans = pack size ÷ amount used per clean (in the same units, e.g. ml). Measure sprays: 10 squirts into a jug, then divide by 10.

Product	Price paid	Pack size (ml / sachets / washes)	Used per clean	Cleans per pack	Cost per clean

Before you compare

- ☐ Same job? (a floor bucket vs a worktop spray isn't a fair test)
- ☐ Same currency?
- ☐ Followed the label dose? (over-dosing doubles the cost)
- ☐ Counted a reusable bottle if you had to buy one?
- ☐ Does the cheaper one need more scrubbing?

Worked example (made-up numbers): £2.00 spray, 500 ml, 10 ml per clean → 50 cleans → **4p per clean**.
